

Acid Etch®

Acid Etch® is 35% high viscosity phosphoric acid. Our Acid Etch® is silica and glycerin-free, providing a deeper etch pattern for easier application of bonding material. For increased patient comfort and easy clean-up, Acid Etch® is highly viscous, allowing for more accurate placement on enamel or dentin. Material will not slump, slide or run. Acid Etch® is clear aqua blue in color, odorless and tasteless. Allows flowability and clarity while providing complete coverage. Ideal for everyday restorative procedures within every office.
